

1. Write a function in C that takes an array of integers and its size, and returns the second largest element.

Constraints:

- Do not sort the array.
 - Assume the array has at least two distinct elements.
2. You are given an 8-bit register represented as an unsigned char. Write a function to:
 - Set the 3rd bit (bit index 2).
 - Clear the 6th bit (bit index 5).
 - Toggle the 1st bit (bit index 0). Return the modified register value.

Note: Use bitwise operators only. Avoid loops or conditionals.

3. Write a C program to print a pyramid of stars for a given number n .

If $n = 5$, the output should be:

```
*  
  
***  
  
*****  
  
*****  
  
*****
```
